QuestionAnswer What are the basic rules for naming organic compounds using IUPAC nomenclature? The basic rules involve identifying the longest carbon chain, assigning the correct prefix for substituents, numbering the chain to give the lowest possible numbers to substituents, and using proper suffixes for functional groups, ensuring the name is unambiguous and systematic. How do you name a cycloalkane with substituents according to IUPAC rules? Cycloalkanes are named with the prefix 'cyclo' followed by the alkane name (e.g., cyclopentane). Substituents are named as prefixes and numbered to give the lowest possible numbers, with the numbers placed before the substituent name, separated by commas if multiple, and ordered alphabetically if there are multiple

substituents. What is the proper way to name compounds with multiple functional groups? When multiple functional groups are present, the functional group with the highest priority (as per IUPAC rules) receives the suffix, and other groups are named as prefixes. The chain is numbered to give the lowest possible numbers to the highest priority functional group, and substituents are named accordingly. How are stereochemistry and geometric isomers represented in IUPAC nomenclature? Stereochemistry is indicated using prefixes like 'R' and 'S' for chiral centers, and 'E' and 'Z' for alkenes, placed before the compound name. These designations specify the spatial arrangement of substituents, essential for differentiating stereoisomers. Can you explain the nomenclature for organic compounds with halogen substituents? Halogen substituents (F, Cl, Br, I) are named as prefixes (fluoro, chloro, bromo, iodo) and are numbered based on their position on the main chain. They are listed alphabetically in the name, regardless of their position numbers, with position numbers indicating where they are attached.
