- Internal fertilization, often with complex mating behaviors.
- Ectothermy, influencing their activity patterns and habitat preferences.

Birds: The Avian Evolutionary Marvels

Birds, classified as Aves, are distinguished by their feathers, hollow bones, and high metabolic rate. They are endothermic, maintaining a constant internal body temperature, which permits active flight and diverse behaviors.

Unique features of birds include:

- Feathers for flight, insulation, and display.
- Lightweight skeletal structures with pneumatic bones.
- Efficient respiratory system with air sacs for continuous airflow.
- Highly developed sensory organs and complex behaviors.

Evolutionary link: Birds are believed to have evolved from small, feathered theropod dinosaurs, making them a prime example of evolutionary adaptation and convergence.
