Multiple-Choice Question Example

Q: Which of the following is a renewable source of energy?

- a) Coal
- b) Natural Gas
- c) Solar Energy
- d) Petroleum

Answer: c) Solar Energy

Short-Answer Question Example

Q: Explain the process of photosynthesis and mention the importance of chlorophyll.

Answer: Photosynthesis is the process by which green plants convert sunlight, carbon dioxide, and water into glucose and oxygen. Chlorophyll, the green pigment in plants, absorbs sunlight and facilitates the conversion of light energy into chemical energy during photosynthesis. This process is vital for producing food for the plant and providing oxygen for other living organisms.

Long-Answer Question Example

Q: Describe the working principle of an electric bulb and explain why it produces light when switched on.

Answer: An electric bulb works based on the principle of electrical resistance. When current passes through the filament, usually made of tungsten, it encounters resistance, causing the filament to heat up to a high temperature. The high temperature causes the filament to emit visible light, a process known as incandescence. The glass bulb surrounds the filament to protect it from oxidation and contain an inert gas to prolong its lifespan. The production of light occurs as the heated filament releases photons due to thermal radiation.
