Introduction to Crystallography in Engineering Physics

Crystallography is a branch of science that examines the arrangement of atoms within solids. Understanding crystal structures is crucial for engineers because it influences the mechanical, electrical, optical, and thermal properties of materials. In the context of engineering physics, crystallography aids in designing new materials, analyzing defects, and interpreting material behavior under various conditions.

The fundamental goal of crystallography is to determine the internal arrangement of atoms in a solid, which is achieved through analyzing the symmetry, lattice parameters, and diffraction patterns. This knowledge enables engineers to manipulate materials for specific applications such as semiconductors, catalysts, and structural composites.

Basic Concepts in Crystallography

What is a Crystal?

A crystal is a solid material whose atoms, ions, or molecules are arranged in an orderly, repeating pattern extending in all three spatial dimensions. This periodic arrangement results in a definite geometric shape with flat faces called crystal faces.

Unit Cell

The smallest repeating unit in a crystal lattice that captures the entire symmetry and structure of the crystal is known as the unit cell. It is characterized by:

- Lattice parameters: Lengths of edges (a , b , c) and angles between them (α , β , γ).
- Lattice points: Positions within the unit cell where the atoms are located.

Types of Crystals

Crystals are classified based on their symmetry and lattice system into:

- Cubic (isometric)
- Tetragonal
- Orthorhombic
- Hexagonal
- Trigonal (Rhombohedral)
- Monoclinic
- Triclinic

Crystal Systems and Bravais Lattices

Crystal Systems

The seven crystal systems are distinguished by their unit cell dimensions and angles. Understanding these helps in classifying crystals and predicting their properties.

Crystal System	Lattice Parameters	Description
Cubic	$a = b = c$; $\alpha = \beta = \gamma = 90^\circ$	Equal axes, right angles
Tetragonal	$a = b \neq c$; $\alpha = \beta = \gamma = 90^\circ$	Two equal axes, one different
Orthorhombic	$a \neq b \neq c$; $\alpha = \beta = \gamma = 90^\circ$	All axes different, right angles
Hexagonal	$a = b \neq c$; $\alpha = \beta = 90^\circ$, $\gamma = 120^\circ$	Two equal axes, 120° angle

| Trigonal/Rhombohedral | $a = b = c$; $\alpha = \beta = \gamma \neq 90^\circ$ | Equal axes, equal angles not 90° |

| Monoclinic | $a \neq b \neq c$; $\alpha = \beta = 90^\circ \neq \gamma$ | One angle different |

| Triclinic | $a \neq b \neq c$; $\alpha \neq \beta \neq \gamma \neq 90^\circ$ | No angles equal |
