- Spherical graphite in ductile cast iron imparts ductility and toughness
- Compacted graphite offers a balance between the two

Matrix Types

The matrix phase surrounding the graphite is typically ferritic, pearlitic, or martensitic:

- Ferritic matrix: provides ductility and good machinability
- Pearlitic matrix: offers higher strength and hardness
- Martensitic matrix: used in specialty applications requiring high hardness

Mechanical Properties Overview

Depending on the cast iron type and microstructure, properties vary:

- Tensile strength ranges from 150 MPa (gray cast iron) to over 550 MPa (compacted ductile iron)
- Hardness can vary from 100 HB (gray cast iron) to over 300 HB (white cast iron)
- Impact resistance is highest in ductile cast iron

The Handbook details how heat treatment, alloying additions (such as nickel, chromium, molybdenum), and microstructure control can optimize these properties for desired applications.
